O. M. Beketov National University of Urban Economy in Kharkiv

With the development of cities and industry, the problem of the environment and the creation of normal conditions for human life becomes more and more complex. Greening of populated areas is an organic part of urban planning, the improvement of cities and towns, it is one of the tasks of preserving and reviving the historical and cultural heritage, improving the sanitary and hygienic conditions of human living and the aesthetic expressiveness of the urbanized environment. Park areas contribute to the improvement of air quality and are the habitat and development of flora and fauna. They also contribute to the cohesion of the urban population and improve the quality of its life [1].

The areas of new buildings are mainly surrounded by forest belts and fields that do not perform such functions as: improving the urban air basin, improving the microclimate of the dormitory area and the city as a whole, recreational activities etc. They are concentrated more in central areas. In addition, the number of unorganized semi-stationary recreation areas and parking lots has recently increased. A significant number of tourists are concentrated in the territory of forest parks in the summer. In terms of their consequences, these are the most destructive recreations. And the state of the green fund is a matter of environmental safety of the population [2].

This problem is also relevant for my microdistrict. As we consider it is necessary to carry out functional zoning of the territory of wild gardens. Among the most important areas for residents are a quiet walking areas, and also children's and a fitness and recreation zones. These are recreational areas landscaped with plantings with such park facilities as sheds, gazebos, and so on; playgrounds and sports grounds, jogging, roller-skating tracks etc. Thus, it appears a possibility of involving people from different age and social groups.

Therefore, we believe that the issues of landscaping of the garden and park area of the bedroom communities are currently extremely relevant for the city and the environment as a whole.
